1.

3-way-Merge Sort : Suppose that instead of dividing in half at each step of Merge Sort, you divide into thirds, sort each third, and finally combine all of them using a three-way merge subroutine. What is the overall asymptotic running time of this algorithm? (Hint: Note that the merge step can still be implemented in O(n) time.)

- $\bigcap n(\log(n))^2$
- \mathbf{O}
- $\bigcap n \log(n)$
- \bigcap $n^2 \log(n)$

2.

You are given functions f and g such that f(n)=O(g(n)). Is $f(n)*log_2(f(n)^c)=O(g(n)*log_2(g(n)))$? (Here c is some positive constant.) You should assume that f and g are nondecreasing and always bigger than 1.

- C False
- O True
- $oldsymbol{\mathsf{O}}$ Sometimes yes, sometimes no, depending on the constant c
- $oldsymbol{\mathsf{O}}$ Sometimes yes, sometimes no, depending on the functions f and g

3.

Assume again two (positive) nondecreasing functions f and g such that f(n)=O(g(n)). Is $2^{f(n)}=O(2^{g(n)})$? (Multiple answers may be correct, you should check all of those that apply.)

- lacksquare Sometimes yes, sometimes no (depending on f and g)
- Never
- Always
- lacksquare Yes if $f(n) \leq g(n)$ for all sufficiently large n

4.

k-way-Merge Sort. Suppose you are given k sorted arrays, each with n elements, and you want to combine them into a single array of kn elements. Consider the following approach. Using the merge subroutine taught in lecture, you merge the first 2 arrays, then merge the 3^{rd} given array with this merged version of the first two arrays, then merge the 4^{th} given array with the merged version of the first three arrays, and so on until you merge in the final (k^{th}) input array. What is the running time taken by this successive merging algorithm, as a function of k and k0. (Optional: can you think of a faster way to do the k-way merge procedure?)

- $\bigcap \theta(n\log(k))$
- $oldsymbol{\Theta} = heta(n^2k)$
- $oldsymbol{O}$ $heta(nk^2)$
- \mathbf{O} $\theta(nk)$

1 point 5.

Arrange the following functions in increasing order of growth rate (with g(n) following f(n) in your list if and only if f(n) = O(g(n))).

a) $n^2 \log(n)$

b) 2^n

c) 2^{2^n}

 $\mathsf{d})n^{log(n)}$

e) n^2

Write your 5-letter answer, i.e., the sequence in lower case letters in the space provided. For example, if you feel that the answer is a->b->c->d->e (from smallest to largest), then type abcde in the space provided without any spaces before / after / in between the string.

You can assume that all logarithms are base 2 (though it actually doesn't matter).

WARNING: this question has multiple versions, you might see different ones on different attempts!
